1. Introduction

This reflective report analyses the process of development, designing, and coding of CraftPixel, a responsive and creative academic site created as a part of the Web Design and Coding Basics (DIM22104) module of Ravensbourne University London. The project was done to demonstrate how the theory of design and the front-end development concepts can be incorporated in the form of a portfolio site encompassed by responsive layouts, interactivity, e-commerce simulation and a blog.

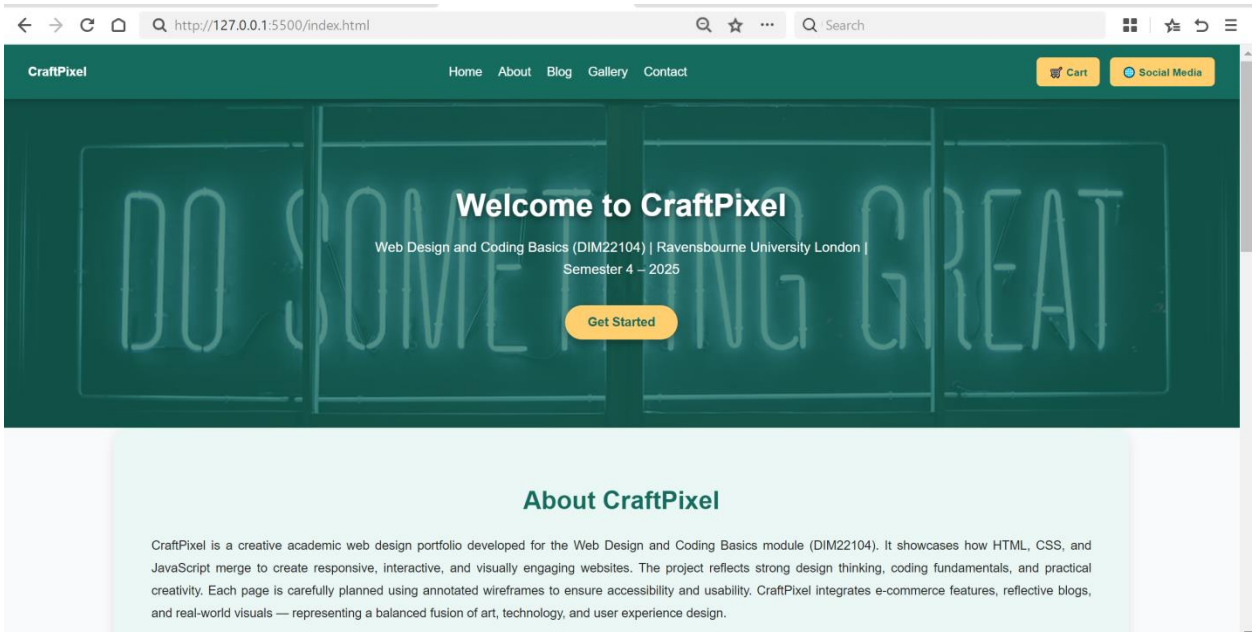

Figure 1CraftPixel

Creating CraftPixel was not just a way of making a working site but a graphic narrative with which the intersection of creativity and code can be reflected in the digital media practice. The project was supposed to be at the professional standard with the help of HTML5, CSS3, and JavaScript that would meet the requirements of the modern industry(Mohajeri, 2023).

This reflection will examine every part of the development process, such as conceptualisation and design planning up to the coding implementation, which will depend on user choices, and the evaluation. With the ability to integrate theoretical learnings, practical experience, and critical thinking, CraftPixel is able to utilise its ability to implement the design ideas in a real, functional, and interactive digital product(Zuch, 2022).

2. Planning and Conceptualisation
