1. Introduction

Travel websites are meant to assist users in uncovering travel products and services, which may include accommodation and accessories, among others, and subsequently make wise decisions. In order to be efficient and customer-focused, the current platforms should offer high functionality, which should include interactive search, instantaneous response to filtering, and easy navigation. The open-source React travel site chosen in this project did not have those capabilities, which restricted usability in the conditions of real life. It initially had in place the item displays that were not dynamic, the non-functional login and signup pages, and very little user experience in mind.

The upgrading involved in the work aimed to fix all these constraints by incorporating active interactions in the current structure. Also, real-time keyword search and multi-criteria filtering were implemented, as they enhance easier access to content on both Products and Services pages. Authentication has been redefined to facilitate account creation and authentication with a structured data model in local storage, which is used in a dashboard that is personalized to the authorized user.

All the improvements have been done with the help of systematic development practices such as requirement validation, software design following, systematic implementation, extensive testing, and using management processes like GitHub, called version control. The enhanced system exhibits good progress toward an operational travel application, which is in line with basic usability and software engineering requirements that are conducive in the future with regard to scalability.

A react based travel website where everything is a component starting from the Navbar and ending with footer.
Props are also passed down from one component to another. BrowserRouter, Link, Switch, Route are used to navigate between components or should I say pages. I've also created the sub-pages and added some additional features like photo gallery with filter, etc. I've also used useState hook for state management and useEffect to re-render while user-interaction.
This project has features like: Carousel, Popup, Image zoom, mobile compatability, fetch data from external API endpoints, login and signup form and a lot more :)
Deployment Status: Successfull
