Project Title: Modern Data Engineering Architecture Using the Paris Olympics Dataset

https://github.com/subash0719/Paris-Olympics-Data-Engineering-Project

Main Goals

- To implement a functional and scalable data engineering pipeline inspired by Microsoft Fabric and Azure Cloud architecture.
- To adapt and execute the open-source Paris Olympics data engineering project within Google Colab using PySpark for end-to-end data flow.
- To establish a structured Bronze–Silver–Gold architecture demonstrating modern ETL (Extract, Transform, Load) principles.
- To apply professional software-engineering methodologies including modular development, version control, and automated data validation.
- To provide a proof-of-concept system capable of performing reliable data ingestion, transformation, and analytical preparation using open-source tools.
